

Geometric Models for Algebraic Concepts

Lead Presenter: Gregg Velatini

Co-presenter: Dianna Spence

This session will demonstrate the use of physical and geometric models to illuminate various types of arithmetic and algebraic problems. Examples include the use of algebra tiles for binomial multiplication and completing the square; the use of pattern blocks for combined work-rate problems; Singapore Math-style bar models for mixture problems; and base 10 blocks for percentages and decimal multiplication.

Target grade levels: 7-12
